

Which Sound Shocker is right for me?

“What is Sound Shocker?”

Sound Shocker is a passive audio preamplifier that boosts any headphone output by about +20dB and provides a proper line level output impedance. This means that the headphone output of your player, phone, laptop, etc. will sound about 4 times louder for the same volume setting when connected to the AUX input of your stereo. All this with NO Batteries, NO Switches, just Plug-and-Play.

Selecting the right Sound Shocker is determined by the application.

Sound Shocker™ The original.

Headphone audio preamp for use with most car and home audio systems. This model provides +18dB of gain, a useable bandwidth of 40Hz to >20KH, with standard 3.5mm stereo jacks for input and output. Standard stereo 3.5mm M-M cables are typically used however, other cables with 2.5mm plugs or RCA plugs are readily available for your specific needs.

Sound Shocker Pro™ Big brother provides all the music....

Headphone audio preamp for use with premium home and car audio sound systems. This model offers +20dB of gain. With a bandwidth of 20Hz to 20KHz at just -0.5dB, it brings out the musical depth and detail that has been obscured by poor gain matching.
